

6、TensorRT 板载摄像头实时图像识别教程

准备工作:

开始之前,确定已经完成教程 4、5的所有步骤,能测试简单的例子。

1、进入执行的目录

假如你在 jetson-inference 目录下请执行以下目录。

cd build/aarch64/bin/

```
camera-viewer
                    detectnet-console.py imagenet-console
                                                               segnet-batch.py
                                                                                   trt-bench
camera-viewer.py
                    gl-display-test
                                          imagenet-console.py segnet-batch.sh
                                                                                   trt-console
cuda-from-numpy.py
                    gl-display-test.py
                                          images
                                                                segnet-camera
                                                                                   v412-console
cuda-to-numpy.py
                    homography-camera
                                          my-detection.py
                                                                segnet-camera.py
                                                                                   v412-display
detectnet-camera
                    homography-console
                                          my-recognition.py
                                                                segnet-console
detectnet-camera.py
                    imagenet-camera
                                          networks
                                                                segnet-console.py
detectnet-console
                    imagenet-camera.pv
                                          output.ipg
                                                                superres-console
```

2、执行图像识别命令

这个时候最好能通过桌面执行,否则可能看不到摄像头的界面,或者通过 VNC 远程桌面连接。

进入到 jetson-inference/ aarch64 / bin 目录下:

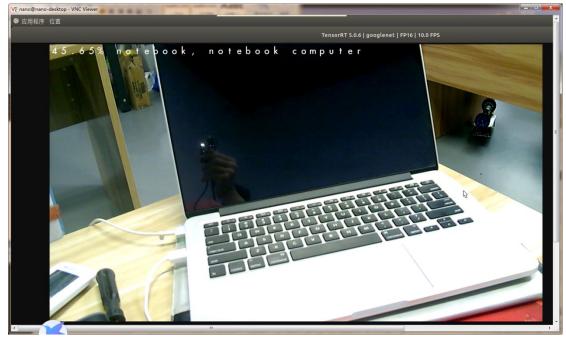

实时图像识别演示位于 jetson-inference/ aarch64 / bin 中并被调用 imagenet-camera。它在实时摄像机流上运行,并根据用户参数,使用 TensorRT 加载 googlenet 或 alexnet。

\$./imagenet-camera googlenet#使用 googlenet 运行\$./imagenet-camera alexnet#使用 alexnet 运行

每秒帧数(FPS),来自视频的分类对象名称和分类对象的置信度被打印到 openGL 窗口标题栏。默认情况下,应用程序可以识别多达 1000 种不同类型的对象,因为 Googlenet 和 Alexnet 是在包含 1000 类对象的 ILSVRC12 ImageNet 数据库上进行培训的。1000种类型对象的名称映射,可以在 repo 下找到 data/networks/ilsvrc12_synset_words.txt

```
nano@nano-desktop: ~/jetson-inference/build/aarch64/bin
File Edit View Search Terminal Help
class 0894 - 0.011559 (wardrobe, closet, press)
class 0905 - 0.148682 (window shade)
imagenet-camera: 17.79785% class #519 (crate)
class 0421 - 0.029892 (bannister, banister, balustrade, balusters, handrail)
class 0453 - 0.022903 (bookcase)
class 0478 - 0.015747
                       (carton)
class 0498 - 0.052887 (cinema, movie theater, movie theatre, movie house, pictu
re palace)
class 0519 - 0.102295 (crate)
class 0526 - 0.026581
                       (desk)
class 0527 - 0.013321 (desktop computer)
class 0553 - 0.043823 (file, file cabinet, filing cabinet) class 0598 - 0.030716 (home theater, home theatre)
class 0664 - 0.016571 (monitor)
class 0713 - 0.014450 (photocopier)
class 0743 - 0.021194 (prison, prison house)
                       (projector)
class 0745 - 0.036469
           - 0.010567
class 0789
                       (shoji)
class 0799 - 0.016373 (sliding door)
class 0818 - 0.133911 (spotlight, spot)
class 0894 - 0.010864 (wardrobe, closet, press)
class 0905 - 0.132935 (window shade)
imagenet-camera: 13.39111% class #818 (spotlight, spot)
```

这样识别到物体就会在上面显示物体英文名称,百分数就是匹配百分比。

注意: 安装新摄像头外壳会出现视频画面颠倒,可用以下方法设置修改:

\$ cd ~/jetson-inference/utils/camera/

\$ gedit gstCamera.cpp

٠.,

- Change the folloing code:

```bash

#if NV\_TENSORRT\_MAJOR > 1 && NV\_TENSORRT\_MAJOR < 5 // if JetPack 3.1-3.3 (different flip-method)

const int flipMethod = 0; // Xavier (w/TRT5) camera is mounted inverted
#else

const int flipMethod = 2;

#endif

### 改成以下:

#if NV\_TENSORRT\_MAJOR > 1 && NV\_TENSORRT\_MAJOR < 5 // if JetPack 3.1-3.3 (different flip-method)

const int flipMethod = 0; // Xavier (w/TRT5) camera is mounted inverted
#else

const int flipMethod = 0; //2 变成 0

#endif

...

Build the Code:

```bash

\$ cd ~/jetson-inference/build/

\$ make

\$sudo make install
